Creating more then one player in a MIDlet, Here we have created an 'item' object for Hashtable and put all 'wav' file

in this table with object 'key' and object 'value' which maps the keys to value. In this example we created a list in which title of songs will be displayed on your mobile screen and you can choose any one at a time to play the song. After selecting the song to play, you can see a blank screen with two option button 'stop' and 'pause'. when you clicks on 'pause' button, start button will show and song will be paused but when you clicks on start button then the song will continue, You can click on the left side 'stop' button to exit and return on songs list page.

In this example **javax.microedition.media** package is used to create the player. There are the following class and interface are in this package.

**Control:-** It is a interface which used to control some media processing functions.

**Controllable:-** Controllable provides an interface for obtaining the Controls from an object like a Player.

**Player:-** Player controls the rendering of time based media data.

**PlayerListener:-** PlayerListener is the interface for receiving asynchronous events generated by Players.

**Manager:-** Manager is the access point for obtaining system dependent resources such as Players for multimedia processing.

The Application is as follows:

Media MIDlet Example

I have tried this Media MIDlet Example and it is working very nice, but, I wonder if you can help me to develop this code a little bit. I just want to order item list alphabetically, I mean, to be displayed alphabetically and, if is possible to display a picture for each song, each song with his own picture. I am really appreciating all of your work from this website which I think is a great website for personal education. Thank you very much!

**John Kevin**
