Kxml Parser Example

[Share on Google+](#)

In this example we use "catching parsing events" way to parse the xml.

Kxml Parser Example

[<-Prior](#) [Index](#) [Next->](#)

In this example we use "catching parsing events" way to parse the xml. Through 'catching parsing events', the parser traverses the XML data and issues callbacks to a previously registered event listener whenever it encounters particular structures in the data. For example,

when the parser encounters an opening tag such as <employee> then the event listener would receive an event notifying it of the encounter and pass it any necessary information. A parser implements such a strategy is called a push parser because the parser is "pushing" the event to a listener.

The Entire Application is as follows:
